AI - Powered Handwriting Learning for infants and People with learning disabilities

Innovative Learning with Real-Time Feedback and Interactive Support

Smith Kwabena Agyei (Data Scientist - ITC)
28th October, 2024

Project Overview

It is an amazing and creative idea to teach toddlers and People with learning disabilities to write by using a handwriting recognition model! An AI-powered handwriting model can improve the learning process by offering real-time feedback, interactive learning experiences, and individualized advice, in contrast to traditional teaching methods that involve manual tracing and instruction.

Learning has to be fun.

MNIST Dataset

Python (Numpy, Matplotlib, Pandas, Scipy)

Models (KNN & Naive Bayes)

Project Workflow

Start ⇒ Data Preprocessing

Model Training ⇒

**Naives Bayes – 77%,
Non-Naives Bayes – 93%
KNN –**

Model Testing ⇒

**Naives Bayes – 83%
Non-Naives Bayes – 99%
KNN – 100%**

Naive Bayes: Looks at clues and characteristics independently
Non Naive Bayes: Looks at clues and characteristics wholistically
**KNN:** Looks at the nearest neighbour to the new item

AI- Handwriting Learning - Key features

The Model detects various numbers and Assists infants in drawing shapes and numbers by tracing outlines

Interactive: Engages children with simple prompts like "Write the number 9!"

Writing tool: Uses a tablet/stylus for a hands-on experience. And also possible to use the finger

Feedback: Celebrates each success with visual/audio

Trace the number

Performance Tracking

Records progress and provides caregivers with actionable insights. (Achieving Badges)
Targeted Practice

Identifies strengths and areas for improvement

Benefits

Early Skill Development
Helps develop motor skills and early literacy

Motivation through Play
Makes learning feel like a fun activity rather than a lesson

Adaptable to Individual Needs
Provides personalized feedback, ensuring children learn at their own pace

Handwriting Recognition
Benefits and the Role of AI

Parental & Teacher Involvement
Real-time insights make it easy to support learning

Motivation through Play
Makes learning feel like a fun activity rather than a lesson

Scalable Solution
Adaptable for different languages, learning stages, and environments

AI- Handwriting Learning

Using AI to teach handwriting can provide infants with a structured, interactive, and enjoyable learning experience.

The model offers instant corrections and positive reinforcement, crucial for skill-building in early development.

The adaptive model adjusts to each child's learning pace and provides insights, helping parents and teachers support their child's progress effectively.
